MCHY series

180° ANGULAR GRIPPER - Cam style

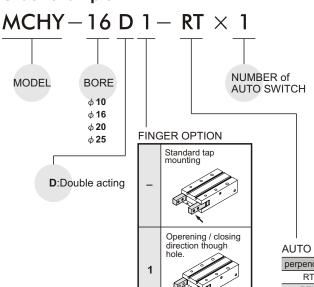

Features:

- Compact design and light weight.
- Gripping forces via piston / cam design.
- Precision reference points on body and fingers are standard.
- Auto switch mounting at 4 locations.
- Resistant to dusty environments.

How to mount attachment on fingers

- To mount an attachment to a finger, make sure to use a wrench to support the attachment so as not to apply undue strain on the finger.
- Refer to the table below for the proper tightening torque on the bolt used for securing the attachment to the finger.

| Model | Bolt | Max.torque N.m |
|---------|--------|----------------|
| MCHY-10 | M3×0.5 | 0.59 |
| MCHY-16 | M4×0.7 | 0.59 |
| MCHY-20 | M5×0.8 | 1.4 |
| MCHY-25 | M6×1 | 2.8 |

Effective holding force

Indication of effective holding force

- 1.Although the condition differs according to the coefficient of friction between the attachment and work, select a model that can produce a holding force of 10 to 20 times the work.
- Further allowance should be provided when great acceleration or impact is expected during work transfer.

Ex.

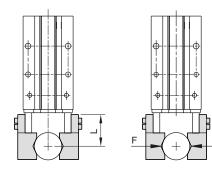

For setting the holding force to be at least 20 times the work weight;

Required holding force = 0.05kg X 20 X 9.8m/s² = 10N min.

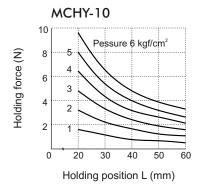

When MCHY-16 is selected, the holding force is determined to be 17N according to the holding point distance (L = 30mm) and the pressure (5kgf/cm²).

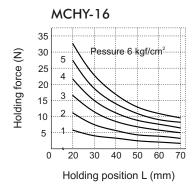

3.The holding force shown in the tables represents the holding force of one finger when all fingers and attachments are in contact with the work.

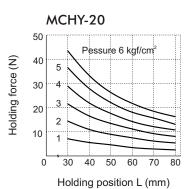

L: Holding point distance F: Thrust of one finger

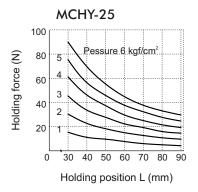

External hold

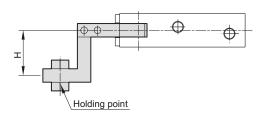

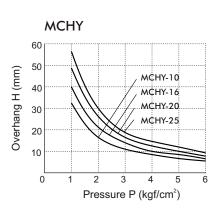

Confirmation of holding point

Work should be held at a point within the tange of overhanging distance (H) for a given preaaure bindicated in the tables. When the work is held at a point outside of the recommended range for a given pressure. it may causes adverse effect on the product life.
